

My task for this week, together with Elisa Gramo and Klaudia Voka, is to find information according to the other modules that we can add. Depending on the specific requirements of the project, there are several modules that can be added to a pastry shop management system to enhance its functionality. Some possible examples include:

- Admin module: This module is designed for the management and administration of the pastry shop. It typically provides features for adding, editing, and deleting products and services, managing orders, monitoring sales and revenue, and overseeing other aspects of the business.
- Customer module: This module is designed for the end-users of the pastry shop, i.e., the customers. It typically provides features for browsing and searching products, placing orders, making payments, tracking orders, and providing feedback or reviews.
- Inventory management module: This module could allow the shop to keep track of its stock levels and ensure that popular items are always in stock.
- Order management module: This module would enable the shop to track incoming orders and manage the order fulfillment process.
- Payment module: This module could allow customers to make payments online, using various payment methods.
- Delivery module: This module could be used to manage the delivery of orders, including tracking packages and providing real-time updates to customers.
- Marketing module: This module could be used to run promotional campaigns, such as offering discounts or sending newsletters to customers.
- Reporting module: This module could generate reports on various aspects of the business, such as sales data, customer behavior, and inventory levels, providing insights that could help inform business decisions.
- Furnitor module: This module can be used as pastry supplier.
